

Sampler for safe operation on critical plant access points

- Imagine your valve sampling point starts leaking and 200 °C fat is spraying out of the reactor (2 barg) and you can't stop it.
- Imagine, your operator does a miss-operation and hot fat is splashing to the bottom and injuring the personal.
- This sampler is designed for safe and over all pressures. You can take sample from vacuum as from over pressure (max. 20 barg).
- Two valves in line insure that this unit is tight and no failure can result in any dangerous leak.
- The ball valves in line are additionally mechanically interlocked, so that never both valves are open at the same time.
